

Solutions for CIS301 Exercise set 6
10 points

Q1. $p \rightarrow q, \sim q \vdash \sim p$

```

1.  $p \rightarrow q$       premise
2.  $\sim q$           premise
... 3.  $p$           assumption
... 4.  $q$            $\rightarrow e$  1,3
... 5.  $\bot$           $\sim e$  4,2
6.  $\sim p$           $\sim i$  3-5

```

Q2. $q \rightarrow r, p \rightarrow \sim r \vdash p \rightarrow \sim q$

```

1.  $q \rightarrow r$       premise
2.  $p \rightarrow \sim r$     premise
... 3.  $p$           assumption
... 4.  $\sim r$          $\rightarrow e$  2,3
... 5.  $q$           assumption
... 6.  $r$            $\rightarrow e$  1,5
... 7.  $\bot$           $\sim e$  6,4
... 8.  $\sim q$         $\sim i$  5-7
9.  $p \rightarrow \sim q$   $\rightarrow i$  3-8

```

Q3. $p \rightarrow q, \sim q \vdash p \rightarrow r$

```

1.  $p \rightarrow q$       premise
2.  $\sim q$           premise
... 3.  $p$           assumption
... 4.  $q$            $\rightarrow e$  1,3
... 5.  $\bot$           $\sim e$  4,2
... 6.  $r$            $\bot e$  5
7.  $p \rightarrow r$      $\rightarrow i$  3-6

```

Q1. $(p \wedge q), r \vdash (p \wedge r) \wedge (s \vee q)$

```

1.  $(p \wedge q)$       premise
2.  $r$               premise
3.  $p$                $\wedge e$  1
4.  $p \wedge r$         $\wedge i$  3,2
5.  $q$                $\wedge e$  1
6.  $s \vee q$          $\vee i$  5
7.  $(p \wedge r) \wedge (s \vee q)$   $\wedge i$  4,6

```

Q2. $p \vee (q \wedge r) \vdash (p \vee q) \wedge (p \vee r)$

```

1.  $p \vee (q \wedge r)$  premise
+-----+
2.  $p$               assumption
3.  $p \vee q$          $\vee i$  1
4.  $p \vee r$          $\vee i$  2
5.  $(p \vee q) \wedge (p \vee r)$   $\wedge i$  3,4
+-----+

```

```

+-----+
6.  $q \wedge r$       assumption
7.  $q$                $\wedge e$  6
8.  $p \vee q$          $\vee i$  7
9.  $r$                $\wedge e$  6
10.  $p \vee r$         $\vee i$  9
11.  $(p \vee q) \wedge (p \vee r)$   $\wedge i$  8,10
+-----+

```

12. $(p \vee q) \wedge (p \vee r)$ $\vee e$ 1,2-5,6-11

Q3. $p \rightarrow q, (p \wedge q) \rightarrow r, p \vdash r \wedge q$

```

1.  $p \rightarrow q$       premise
2.  $(p \wedge q) \rightarrow r$  premise
3.  $p$                 premise
4.  $q$                  $\rightarrow e$  1,3
5.  $p \wedge q$           $\wedge i$  3,4
6.  $r$                  $\rightarrow e$  2,5
7.  $r \wedge q$          $\wedge i$  6,4

```

Q4. $p \rightarrow (q \rightarrow r) \vdash (p \wedge q) \rightarrow r$

```

1.  $p \rightarrow (q \rightarrow r)$  premise
+-----+
2.  $p \wedge q$         assumption
3.  $p$                  $\wedge e$  2
4.  $q \rightarrow r$      $\rightarrow e$  1,3
5.  $q$                  $\wedge e$  2
6.  $r$                  $\rightarrow e$  4,5
+-----+
7.  $(p \wedge q) \rightarrow r$   $\rightarrow i$  2-6

```

Q5. $p \rightarrow r, q \rightarrow s \vdash (p \vee q) \rightarrow (r \vee s)$

```

1.  $p \rightarrow r$       premise
2.  $q \rightarrow s$       premise
+-----+
3.  $p \vee q$           assumption
+-----+
4.  $p$                 assumption
5.  $r$                  $\rightarrow e$  1,4
6.  $r \vee s$            $\vee i$  5
+-----+
+-----+
7.  $q$                 assumption
8.  $s$                  $\rightarrow e$  2,7
9.  $r \vee s$            $\vee i$  8
+-----+
10.  $r \vee s$           $\vee e$  3,4-6,7-9
+-----+
11.  $(p \vee q) \rightarrow (r \vee s)$   $\rightarrow i$  3-10

```

```

def eval(t) :
    """pre:  t  is an ETREE,
            where ETREE ::= NUMERAL |
            [ OP, ETREE1, ETREE2 ]
            NUMERAL is a string,
and OP is  "+" or "-"
            post: ans is the numerical
meaning of t
    """
    if isinstance(t, str) and t.isdigit() :
        ans = int(t)
    else : # t is a list, [op, t1, t2]
        op = t[0]
        t1 = t[1]
        t2 = t[2]
        ans1 = eval(t1)
        # assert:  ans1  is the
numerical meaning of t1
        ans2 = eval(t2)
        # assert:  ans2  is the
numerical meaning of t2
        if op == "+" :
            ans = ans1 + ans2
        elif op == "-" :
            ans = ans1 - ans2
    return ans

```

7,6

... 9. c: int-array
assumption

... 10. 4: int num

... 11. c[4]:int index

9, 10

12. def g(int-array c) return c[4] end:
int-array -> int def 9-11

13. g(b): int call 12,7

14. a = g(b): int assign 3,
13

Q5. Write a proof that shows this program is well-typed:

```

new int a;
a = 2;
new int[9] b;
b[a + a] = a;
def g(int-array c) return c[4] end;
a = g(b)

```

1. new int a: int decvar

2. 2: int num

3. a: int ref 1

4. a = 2: int assign
