

CIS 721 - Real-Time Systems

Lecture 32: SAE AADL: An Architecture Analysis and Design Language for developing embedded real-time systems

Mitch Neilsen

neilsen@ksu.edu

Office: 219D Nichols Hall

Outline

- SAE AADLv2 – Society of Automotive Engineers (SAE) Architecture Analysis and Design Language (AADL), version 2
- OSATE2 – Eclipse plugin for AADLv2
- AADL Key Modeling Constructs
 - AADL Components
 - Properties
 - Connections

Architecture Analysis & Design Language (AADL)

- Specification of computer systems and SoS.
 - Real-time
 - Embedded
 - Fault-tolerant
 - Securely partitioned
 - Dynamically configurable
- Software task and communication architectures
 - Component interface and structure, behavior, properties
- Bound to
 - Distributed multiple processor, integrated hardware architectures
- Fields of application
 - Avionics, Automotive, Aerospace, Autonomous systems, ...
- Context and vocabulary for the integration of System Eng Technology
 - Capture of Architecture (& driving requirements), Analysis of Integration Impact (through model checking), Automated Integration to specification.

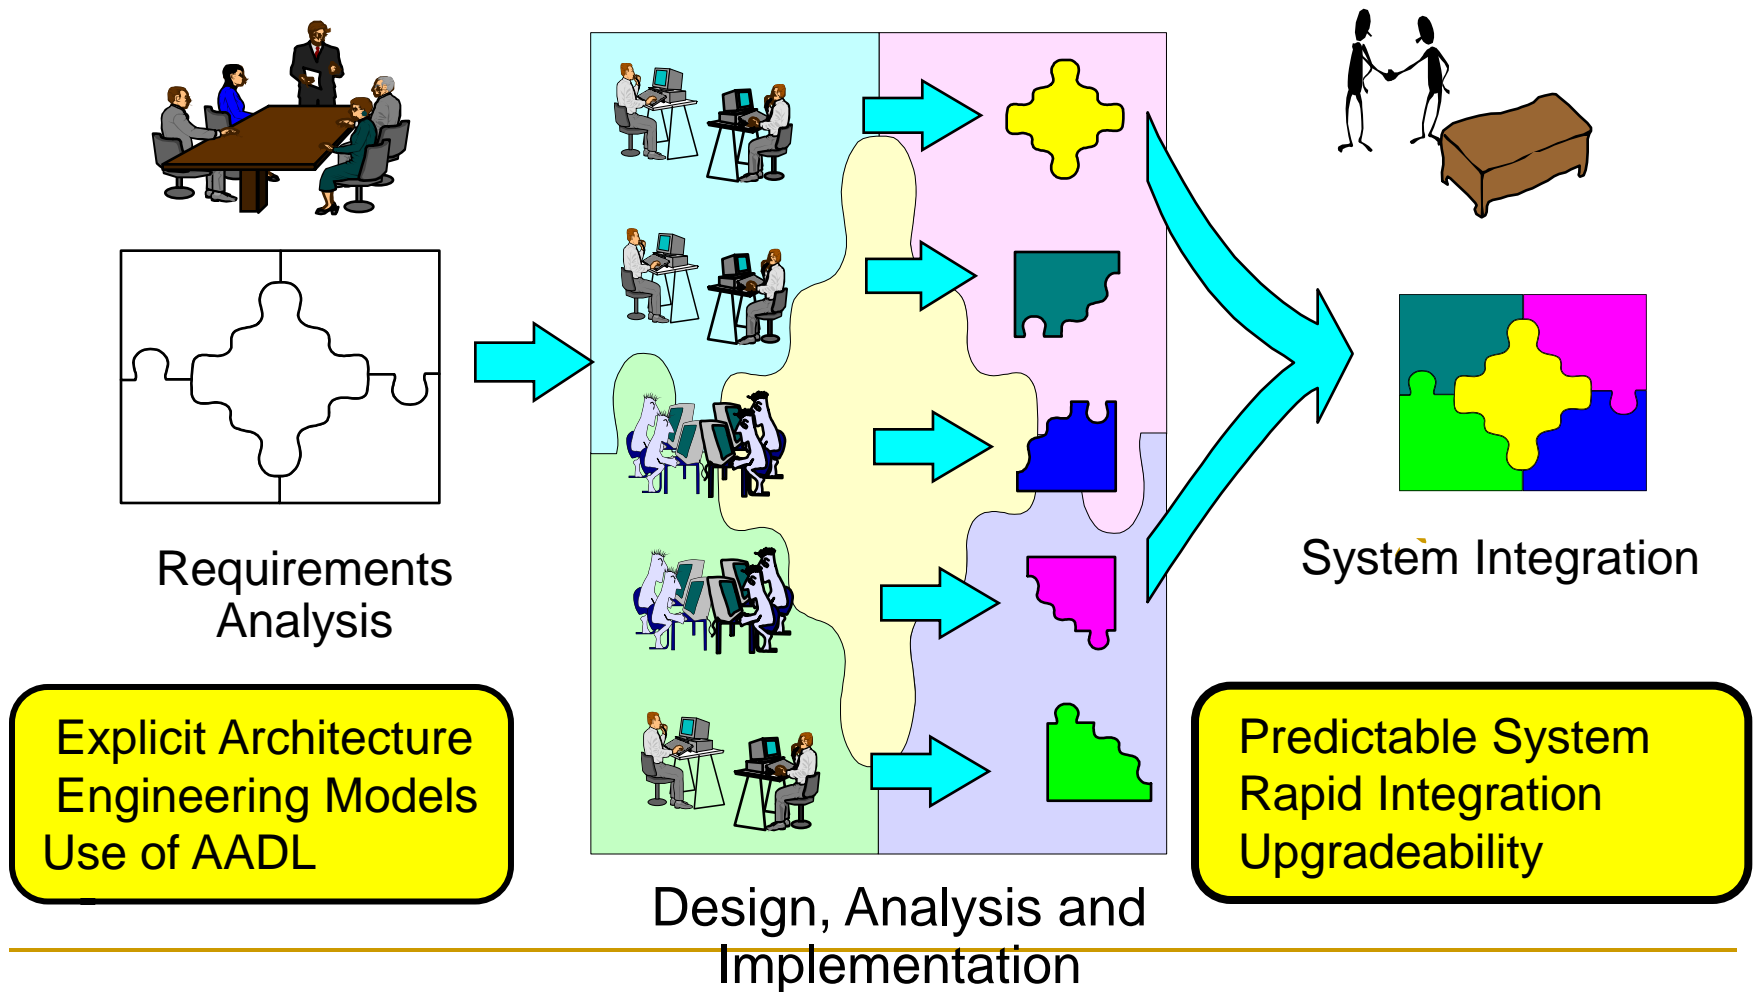

Typical Software Development Process

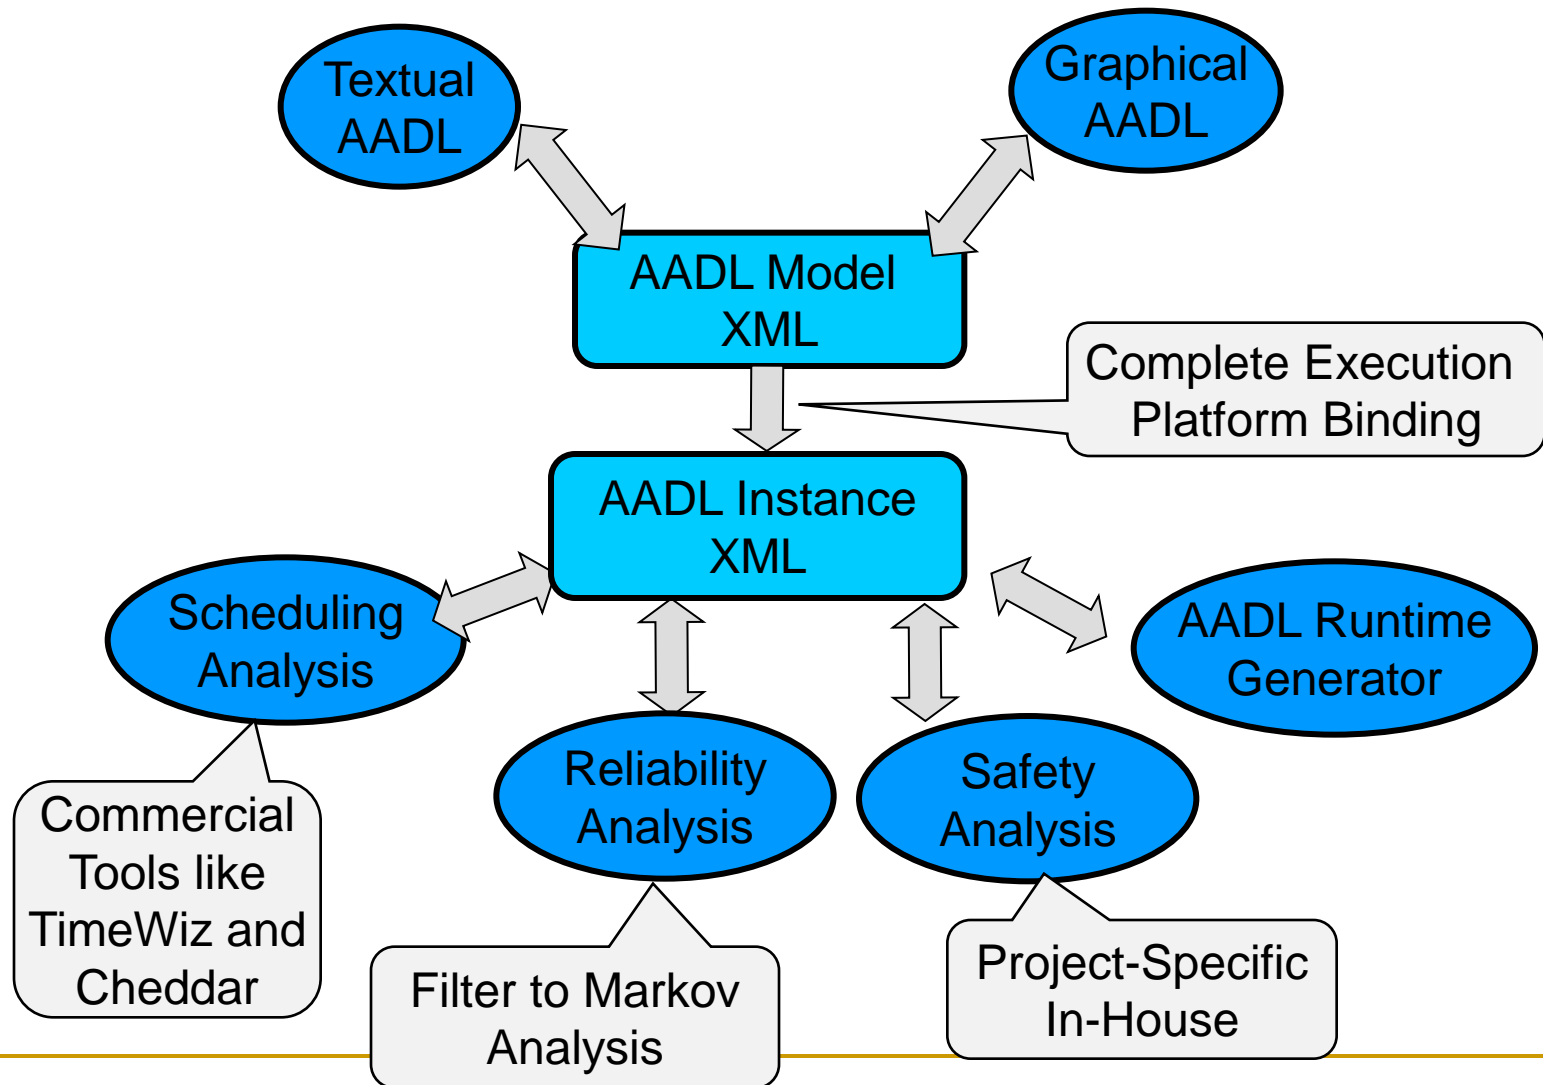

manual, paper intensive, error prone, resistant to change

Model-Based System Engineering

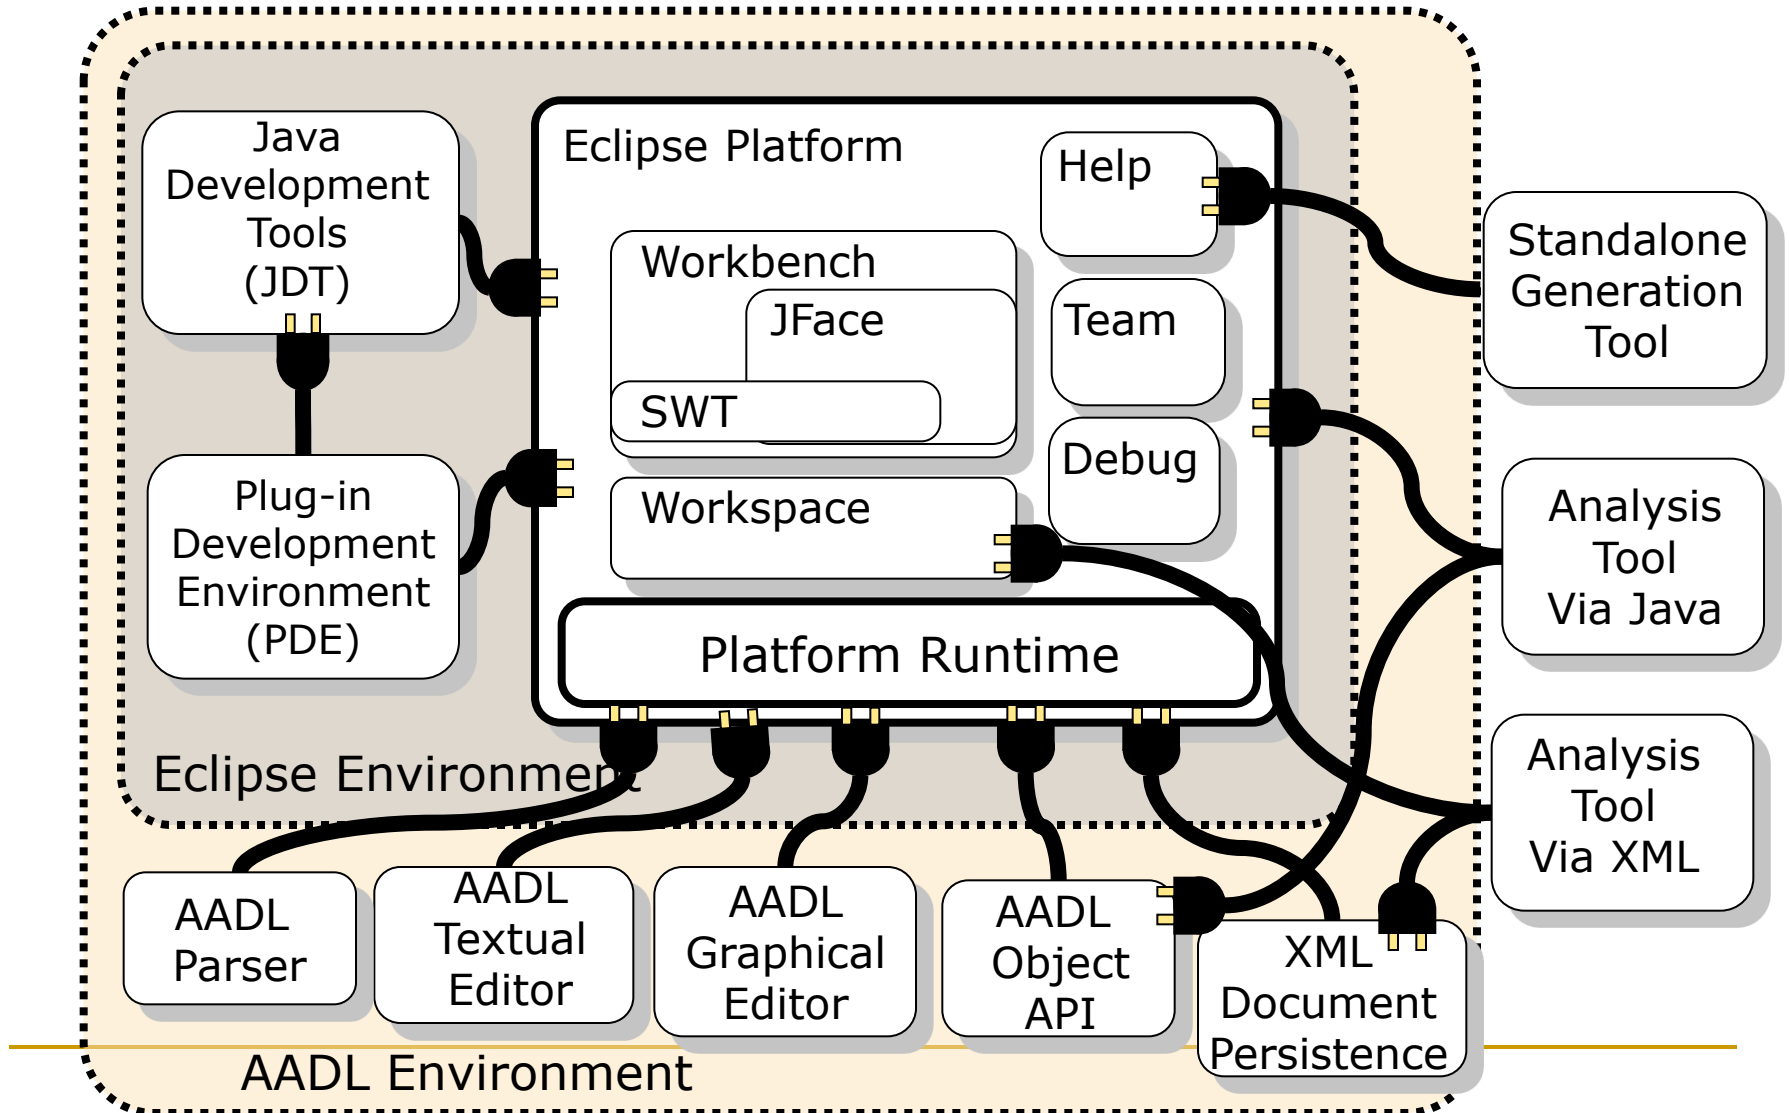

Model-Based & Architecture-Driven

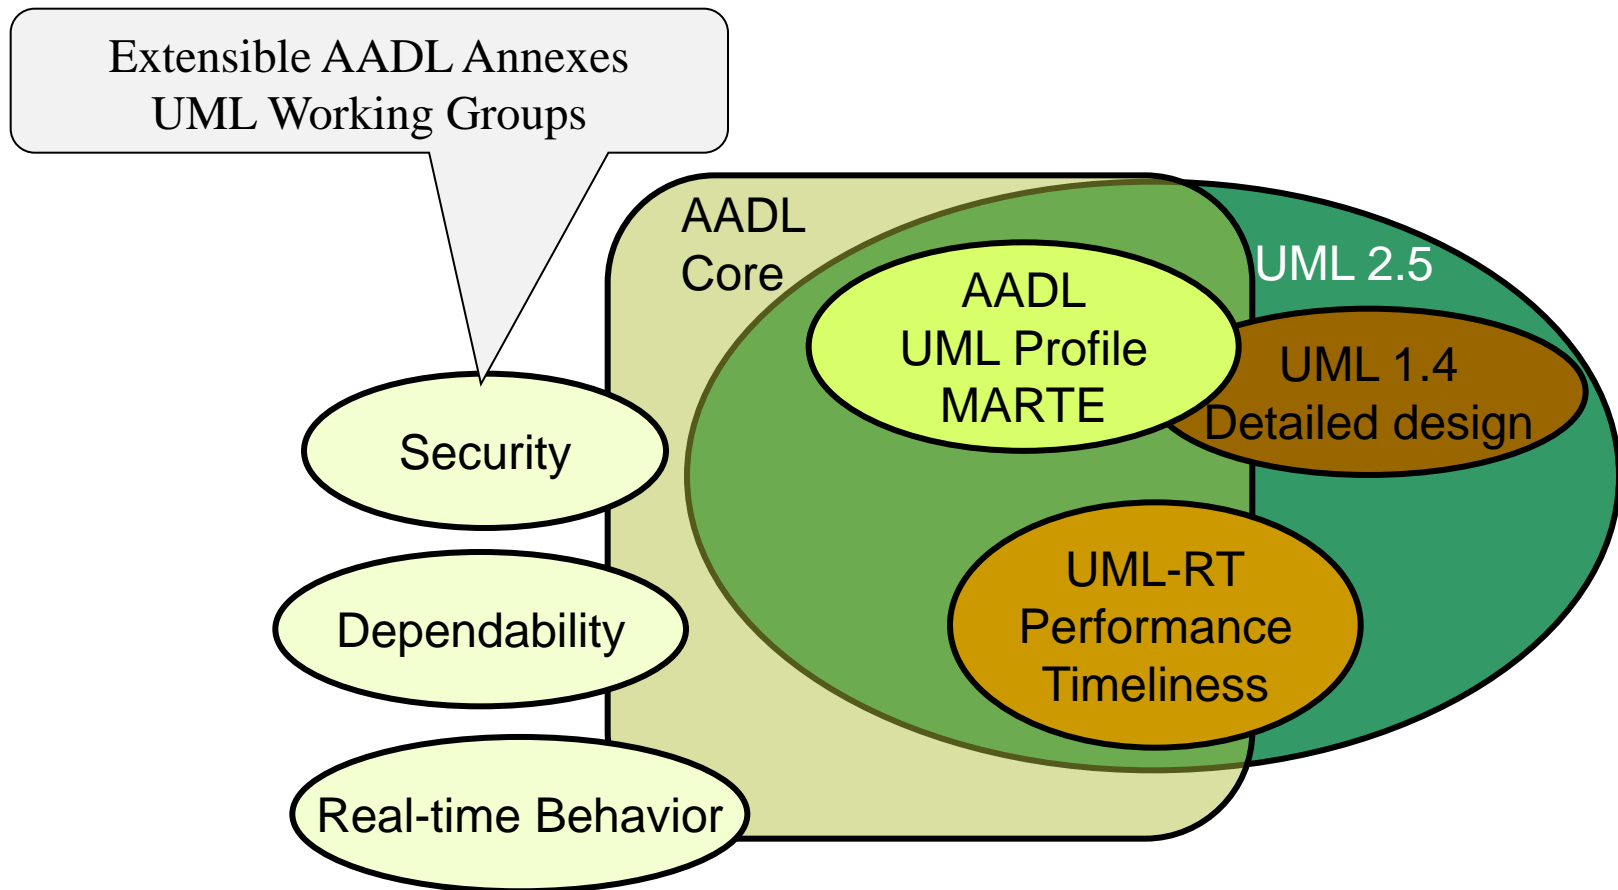

An XML-Based AADL Tool Strategy

OCASE: Open Source AADL Environment

AADL/UML Relationship

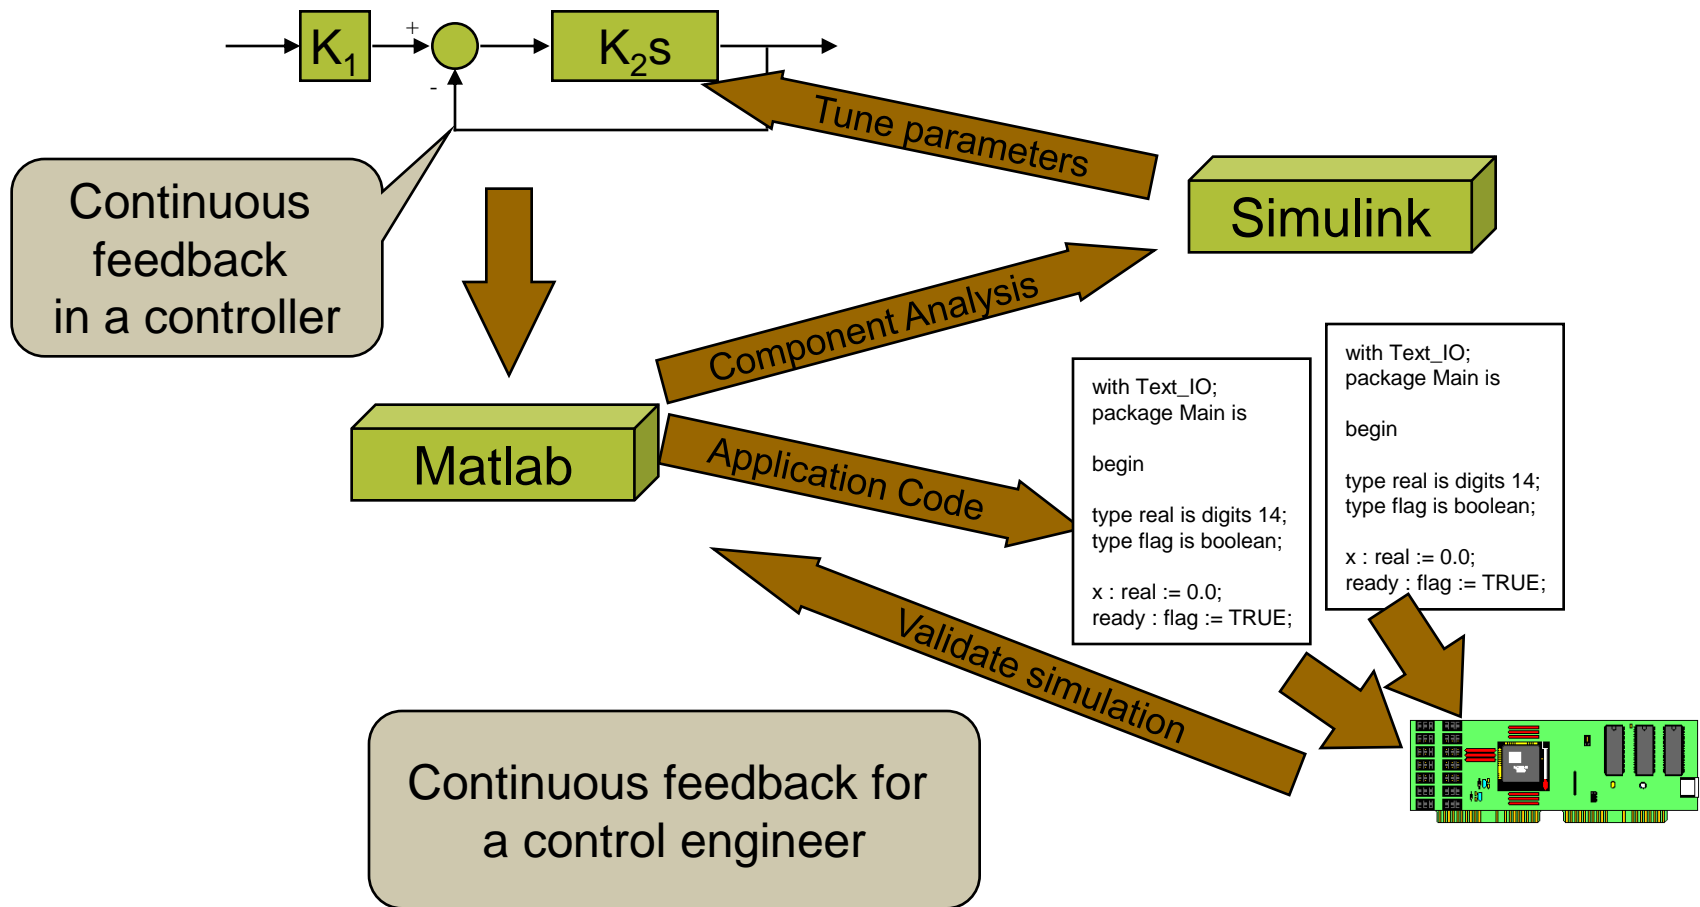

What Is Involved In Using The AADL?

- Specify software & hardware system architectures
- Specify component interfaces and implementation properties
- Analyze system timing, reliability, partition isolation
- Tool-supported software and system integration
- Verify source code compliance & middleware behavior

Model and analyze early and throughout the product life cycle

A Control Engineer Perspective

A Software System Engineer Perspective

Continuous feedback for
software system engineer

```
with Text_IO;  
package Main is  
  
begin  
  
type real is digits 14;  
type flag is boolean;  
  
x : real := 0.0;  
ready : flag := TRUE;
```

12 12			
23 34			
24 23			

R1	R2	R3	R4
12 12	5 6		
23 34	8 8		
24 23	234		

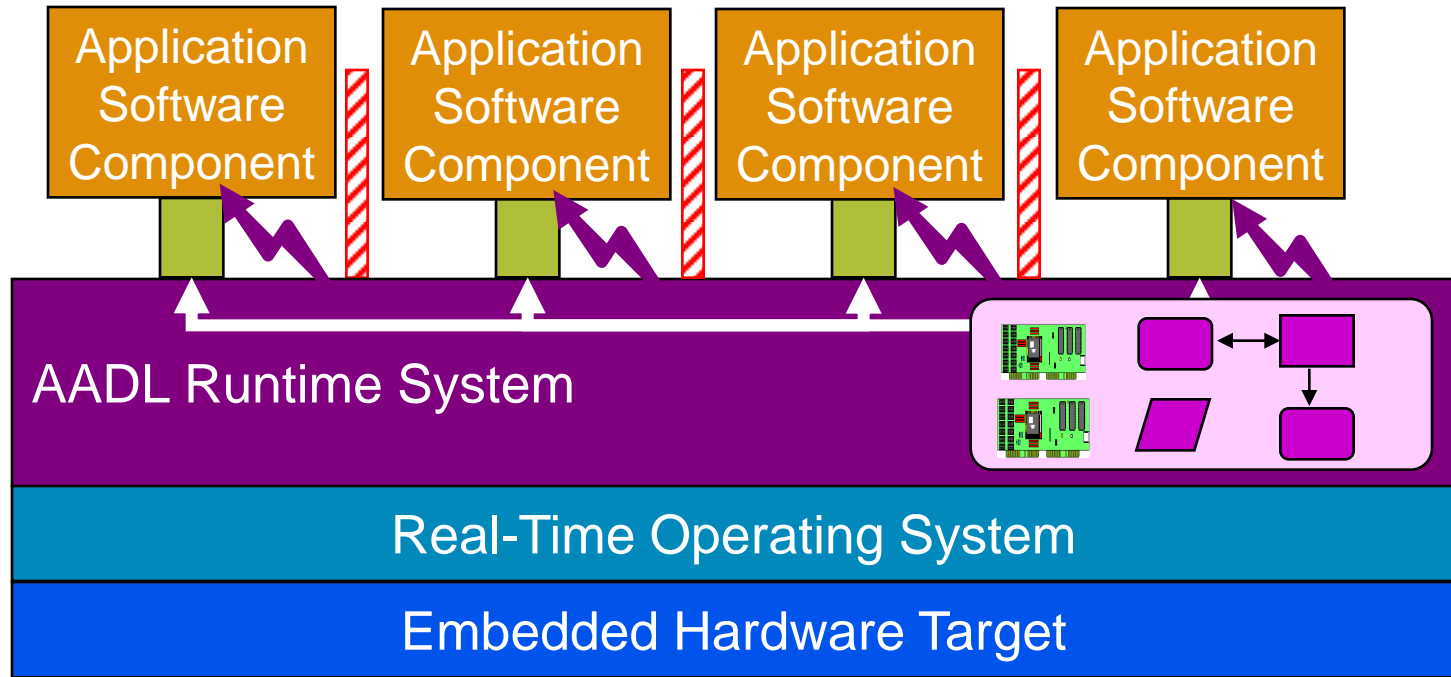

T1	T2	T3	T4
12 1			
23 3			
24 2			

R1	R2	R3	R4
12 12	5 6		
23 34	8 8		
24 23	234		

A Combined Perspective

Application Components as Plug-ins

Strong Partitioning

- Timing Protection
- OS Call Restrictions
- Memory Protection

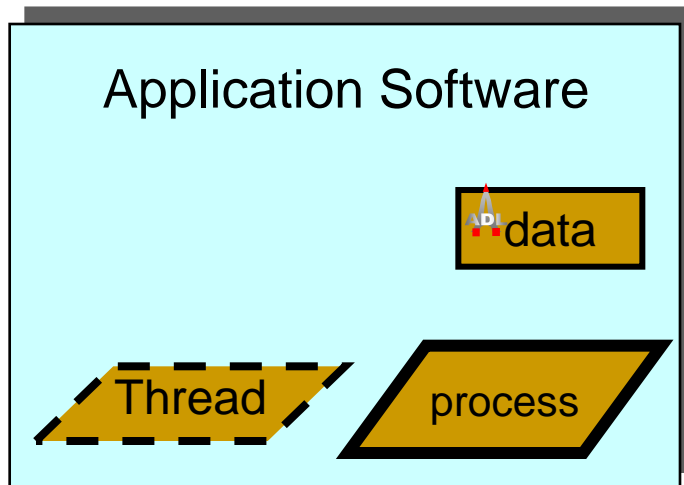

Interoperability/Portability

- Tailored Runtime Executive
- Standard RTOS API
- Application Components

Predictable System Integration

- Required, predicted, and actual runtime properties
 - Application components designed against functional and non-functional properties
 - Application code separated from task dispatch & communication code
 - Consistency between task & communication model and implementation through generation
 - Feedback into model parameters: refinement of estimated performance values
-

AADL Components - Graphical

Modeling Vocabulary

■ Application System

- ❑ Thread
- ❑ Thread Group
- ❑ Process
- ❑ System
- ❑ Package
- ❑ Subprogram
- ❑ Data (shared/message)
- ❑ Data Port
- ❑ Event
- ❑ Event Port
- ❑ Event Data Port
- ❑ Connection
- ❑ Mode

■ Execution Platform

- ❑ Processor
- ❑ Memory
- ❑ Device
- ❑ Bus
- ❑ System

■ Extension

- ❑ Inheritance
- ❑ Properties
- ❑ Sublanguages (safety, flow, user defined, component behavior)
- ❑ Domain Specific Annexes

Graphical and Textual Notation

application code

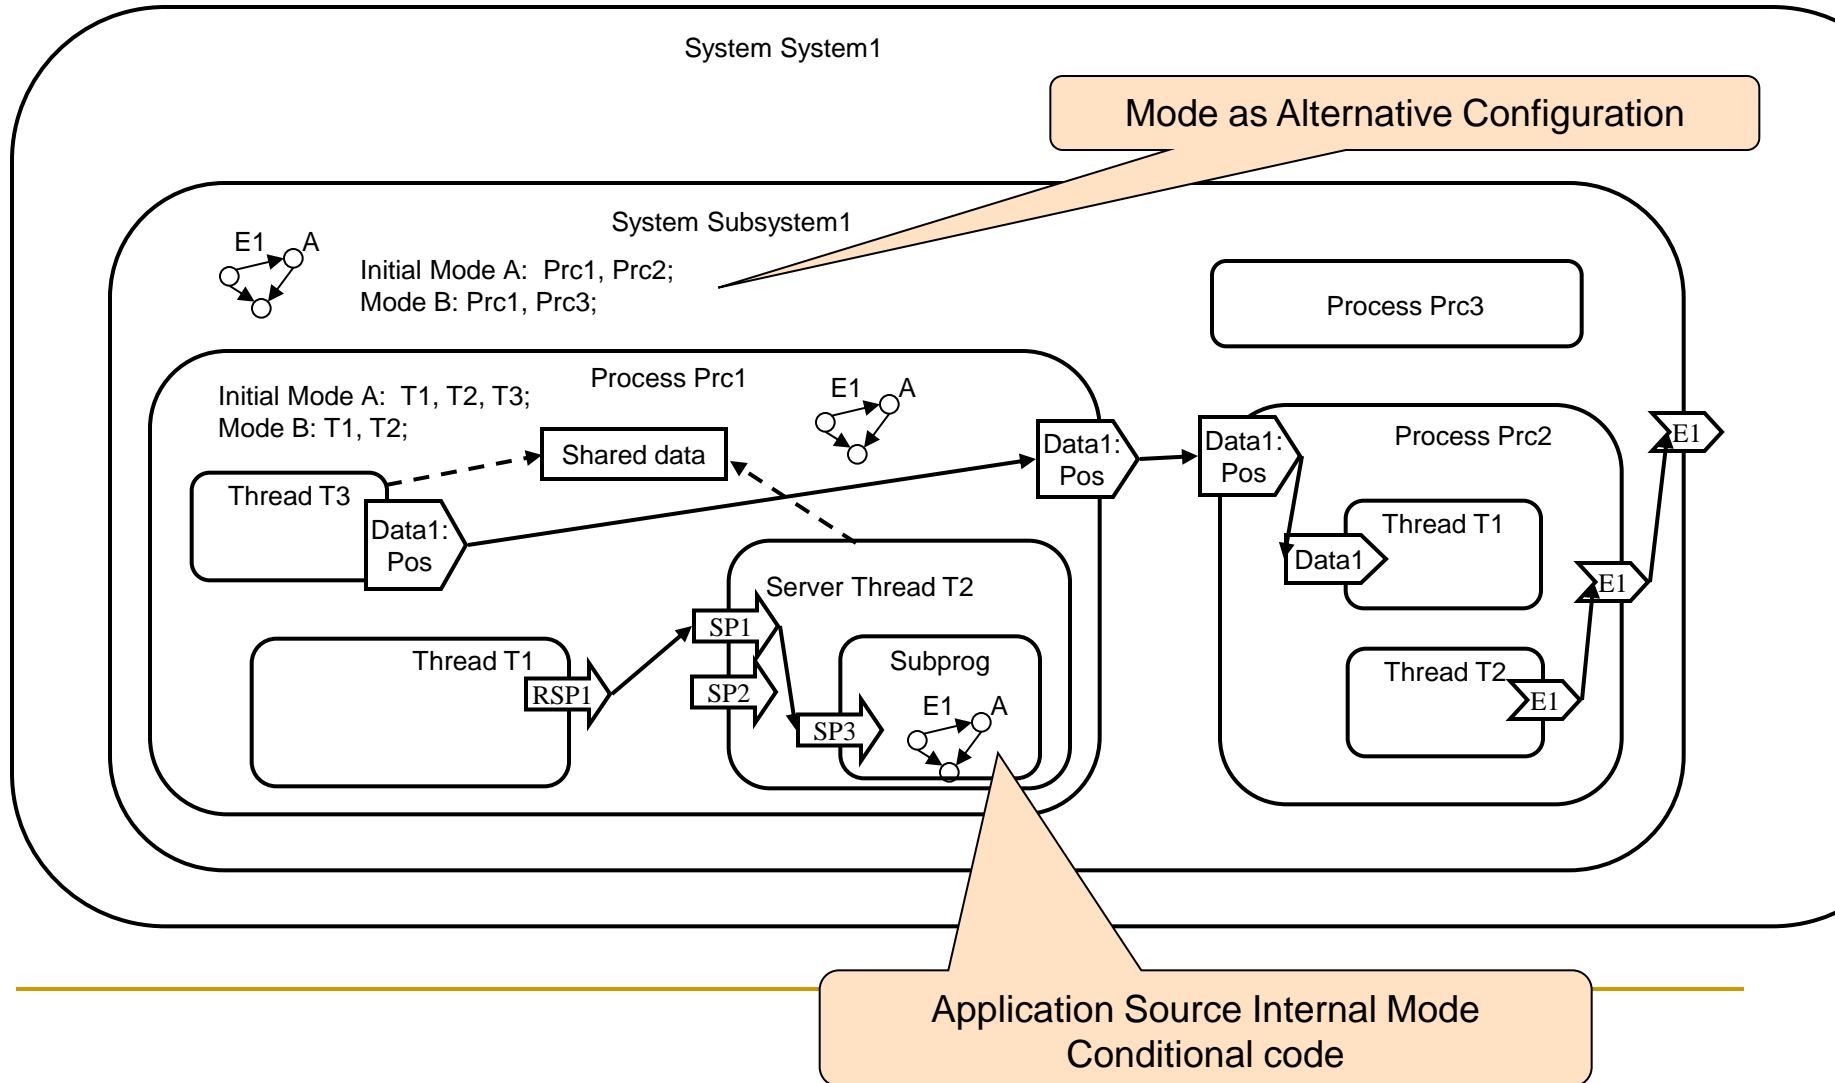

Task and Interaction Architecture

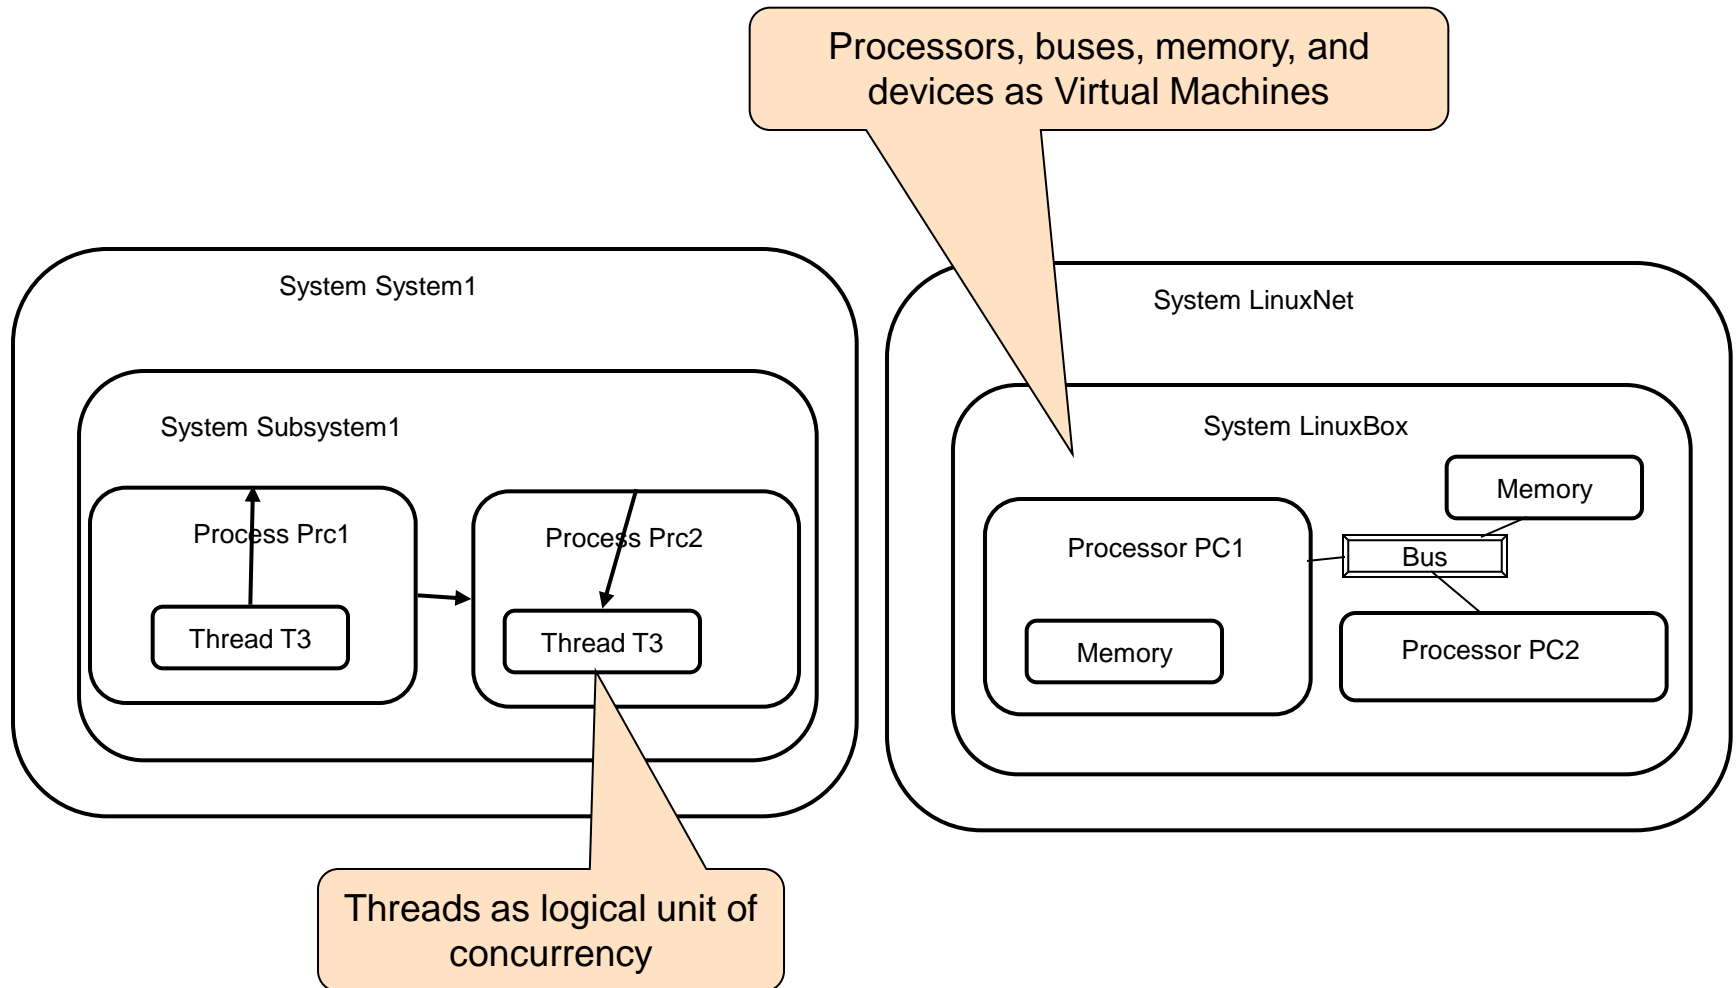

Thread States with Multiple Modes Possible

Hierarchical Modes

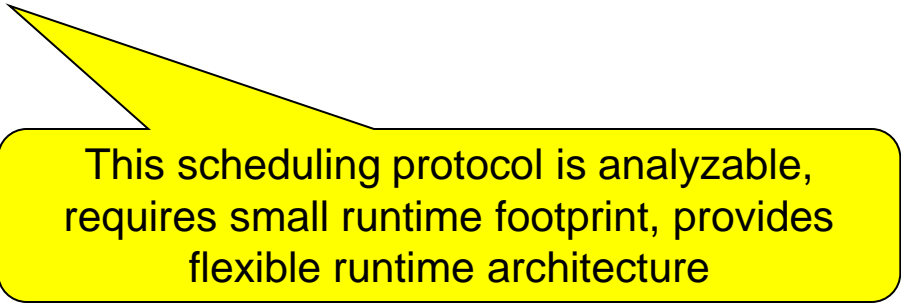

Systems and Execution Platforms

AADL and Scheduling

- AADL provides precise dispatch and communication semantics via hybrid automata
- AADL task and communication abstraction does not prescribe a particular scheduling protocol
 - A cyclic executive can be supported
- Specific scheduling protocols may require additional properties
- Predefined properties support rate-monotonic, fixed priority, preemptive scheduling

This scheduling protocol is analyzable,
requires small runtime footprint, provides
flexible runtime architecture

Faults and Modes

- AADL provides a fault handling framework with precisely defined actions
 - AADL supports runtime changes to task and communication configurations
 - AADL defines timing semantics for task coordination on mode switching
 - AADL supports specification of mode transition actions
 - System initialization and termination are explicitly modeled
-

System Safety Engineering

Capture the results of

- *hazard analysis*
- *component failure modes & effects analysis*

Specify and analyze

- *fault trees*
- *Markov models*
- *partition isolation/event independence*

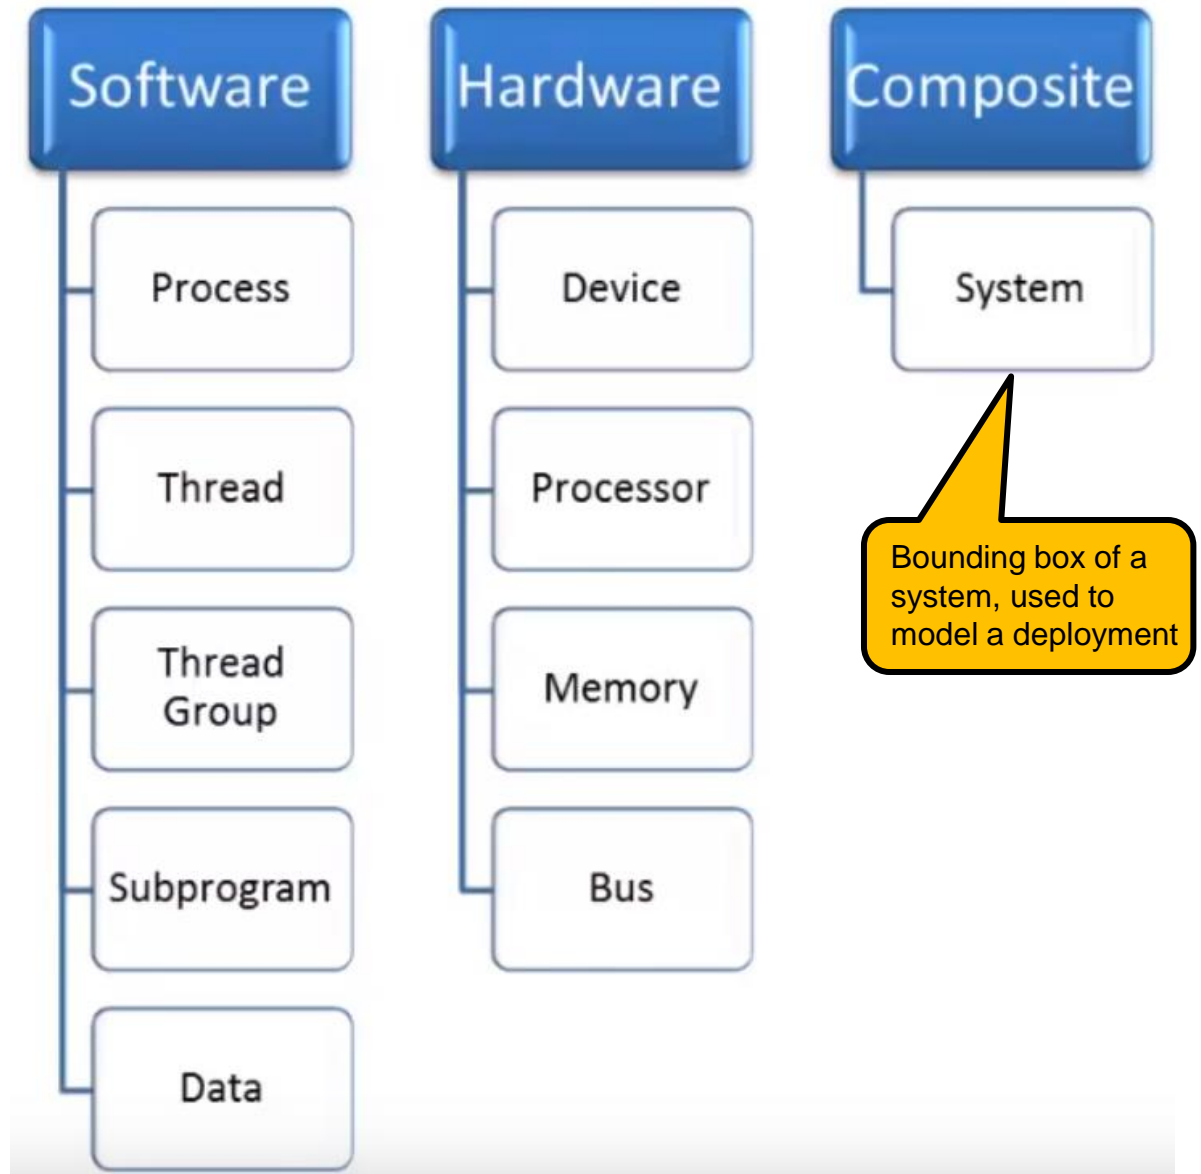

Supported by Error
Model Annex

Integration of system safety with architectural design

- enables cross-checking between models
- insures safety models and design architecture are consistent
- reduces specification and verification effort

Types of AADL Components

- Software
- Hardware
- Composite

Component Definition

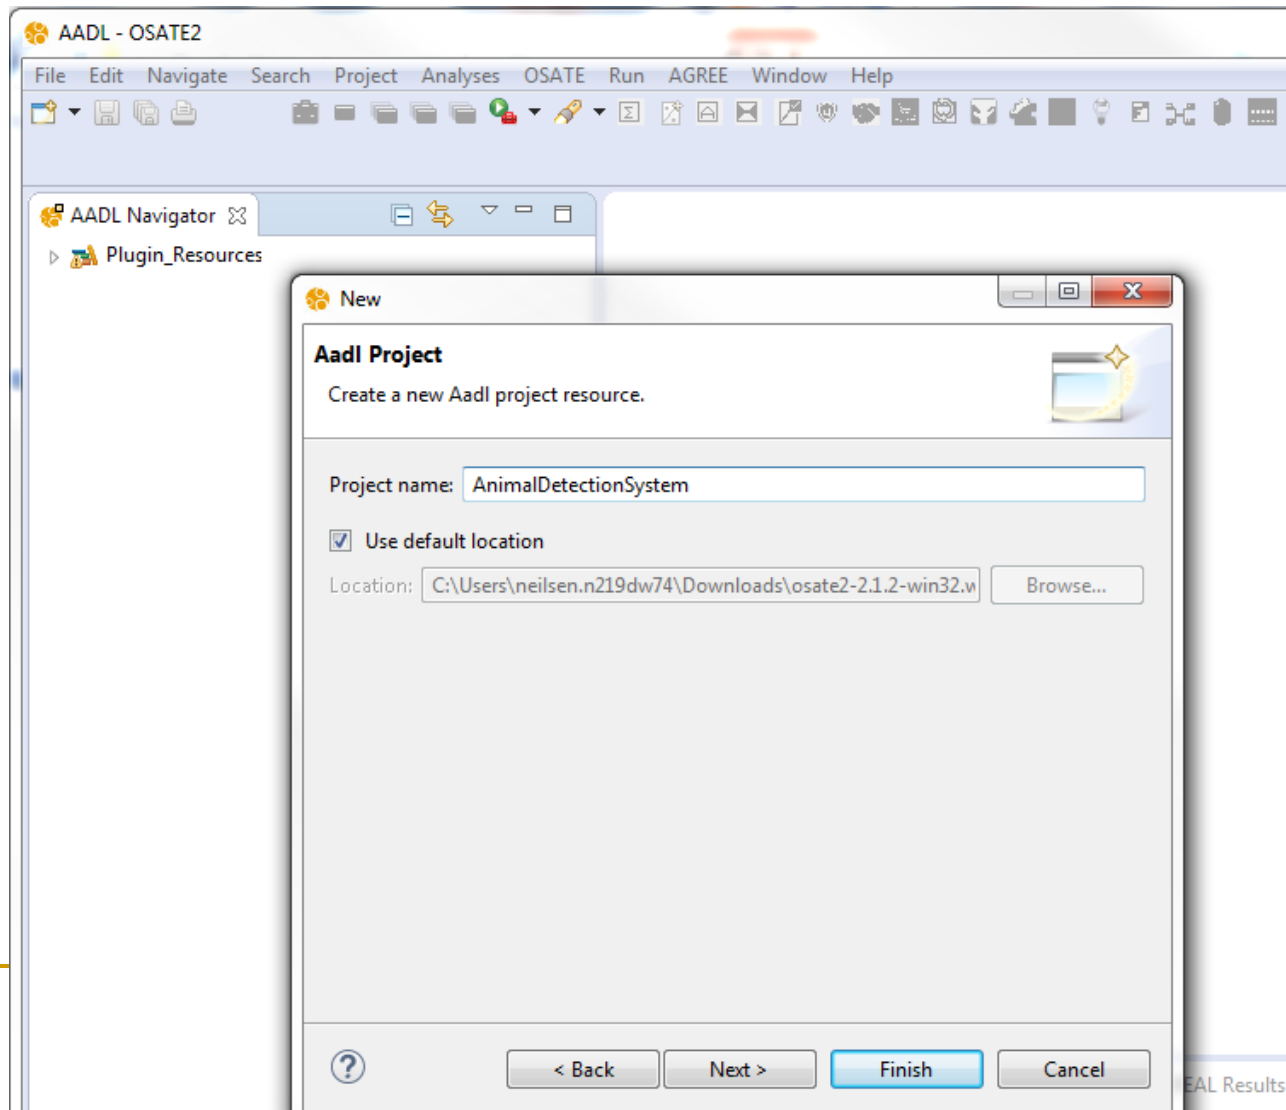

- Type – external view of the component
- Implementation – internal structure or description of a component type

Example: Animal Detection System

- Build an animal detection device to be used remotely in the field, consisting of a **system unit** which contains software, a processor, and memory (Raspberry Pi).
- The **system unit** receives input from a **heat detecting camera** and a **sound sensor**.
- When an animal is detected via heat or sound, the system sends a signal to a **camera**, which starts recording.

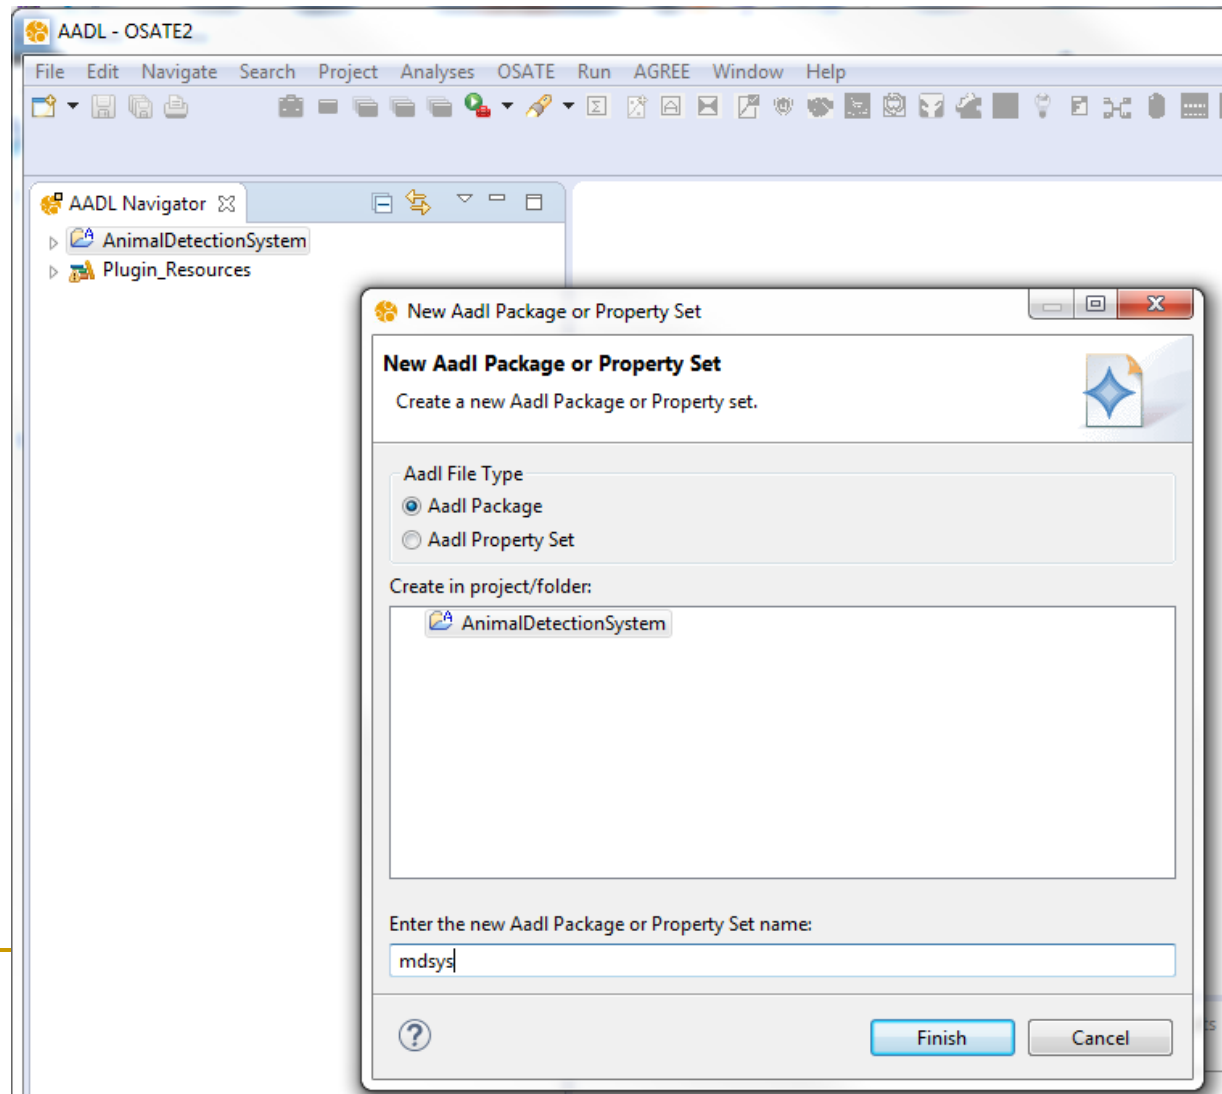

New AADL Project

- In OSATE2, create a new AADL Project:

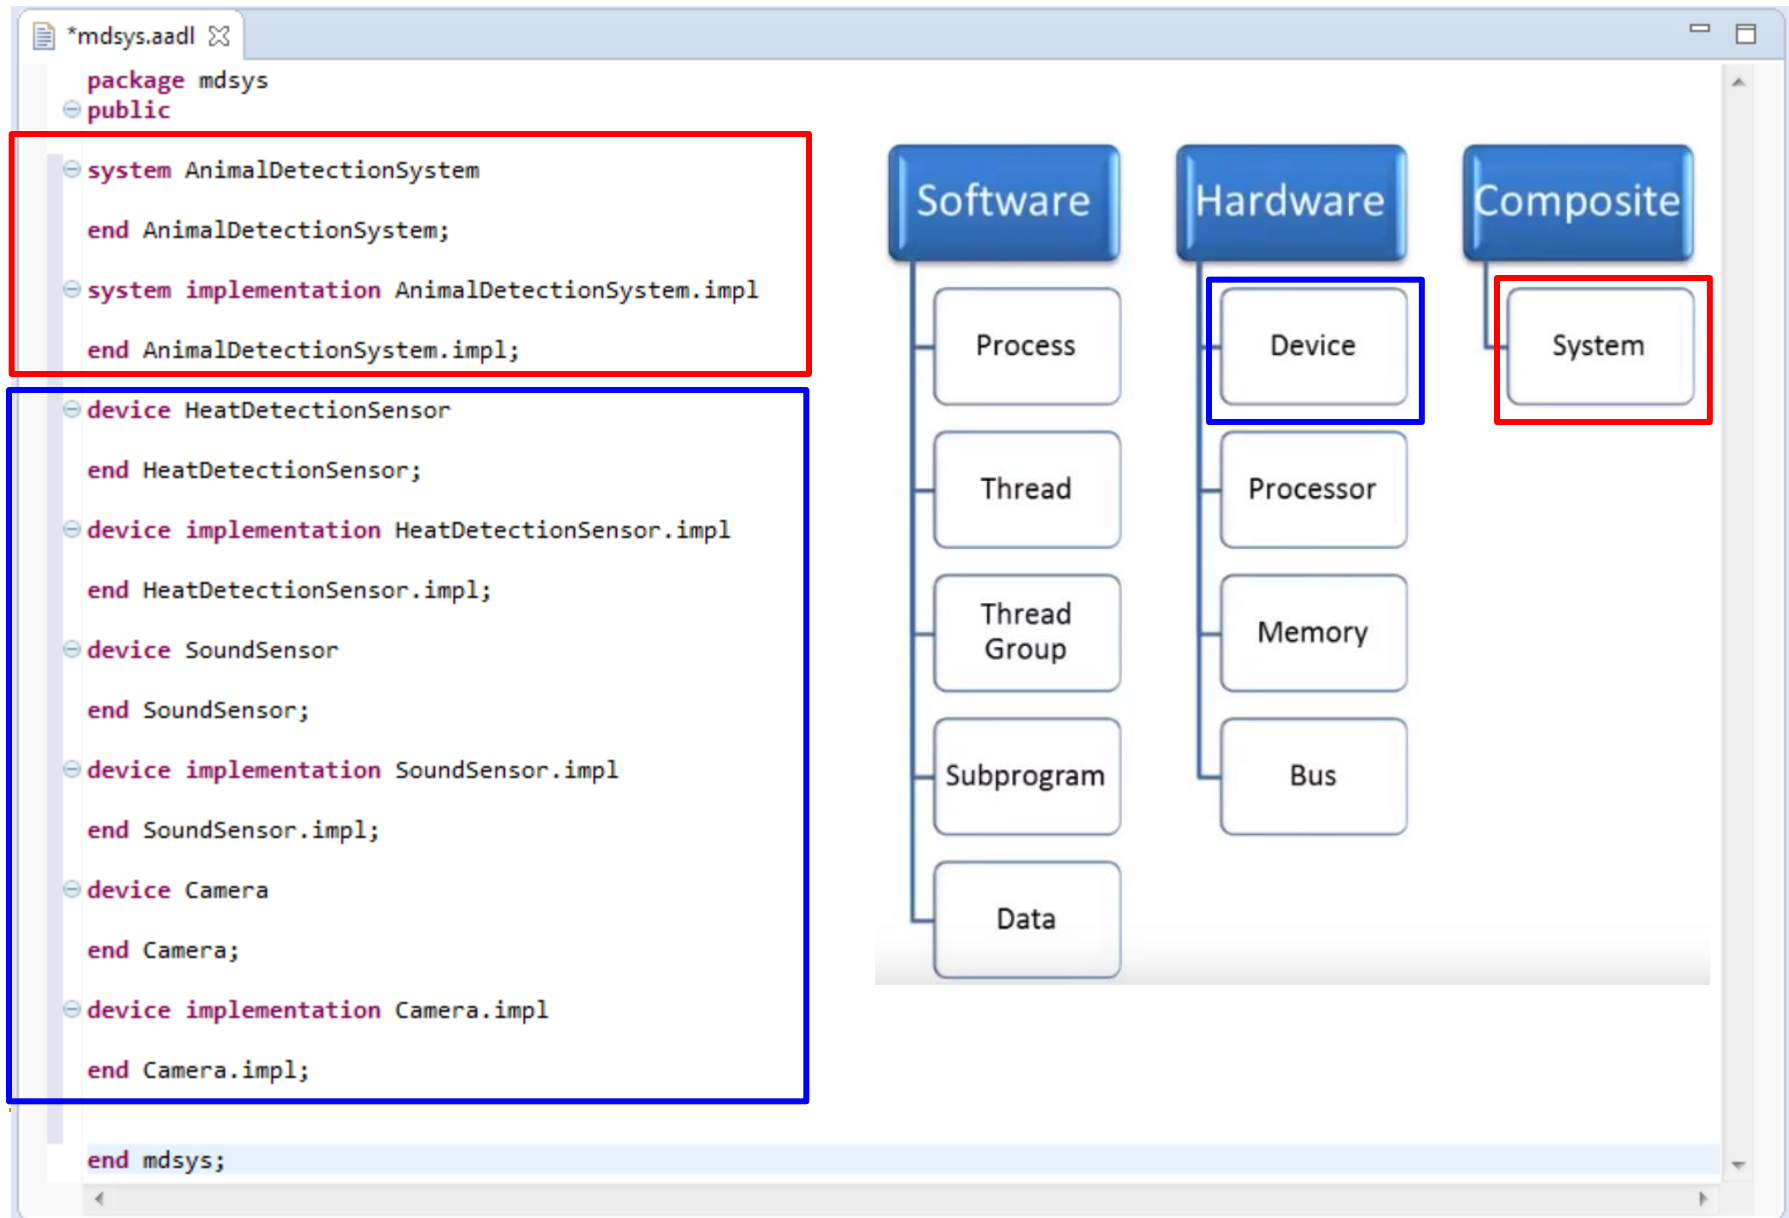

New AADL Model in Project

- Enter an AADL package name for a new AADL Model in the project.

Motion Detection System

Add Controller Process to System

```
⊖ system AnimalDetectionSystem
    end AnimalDetectionSystem;

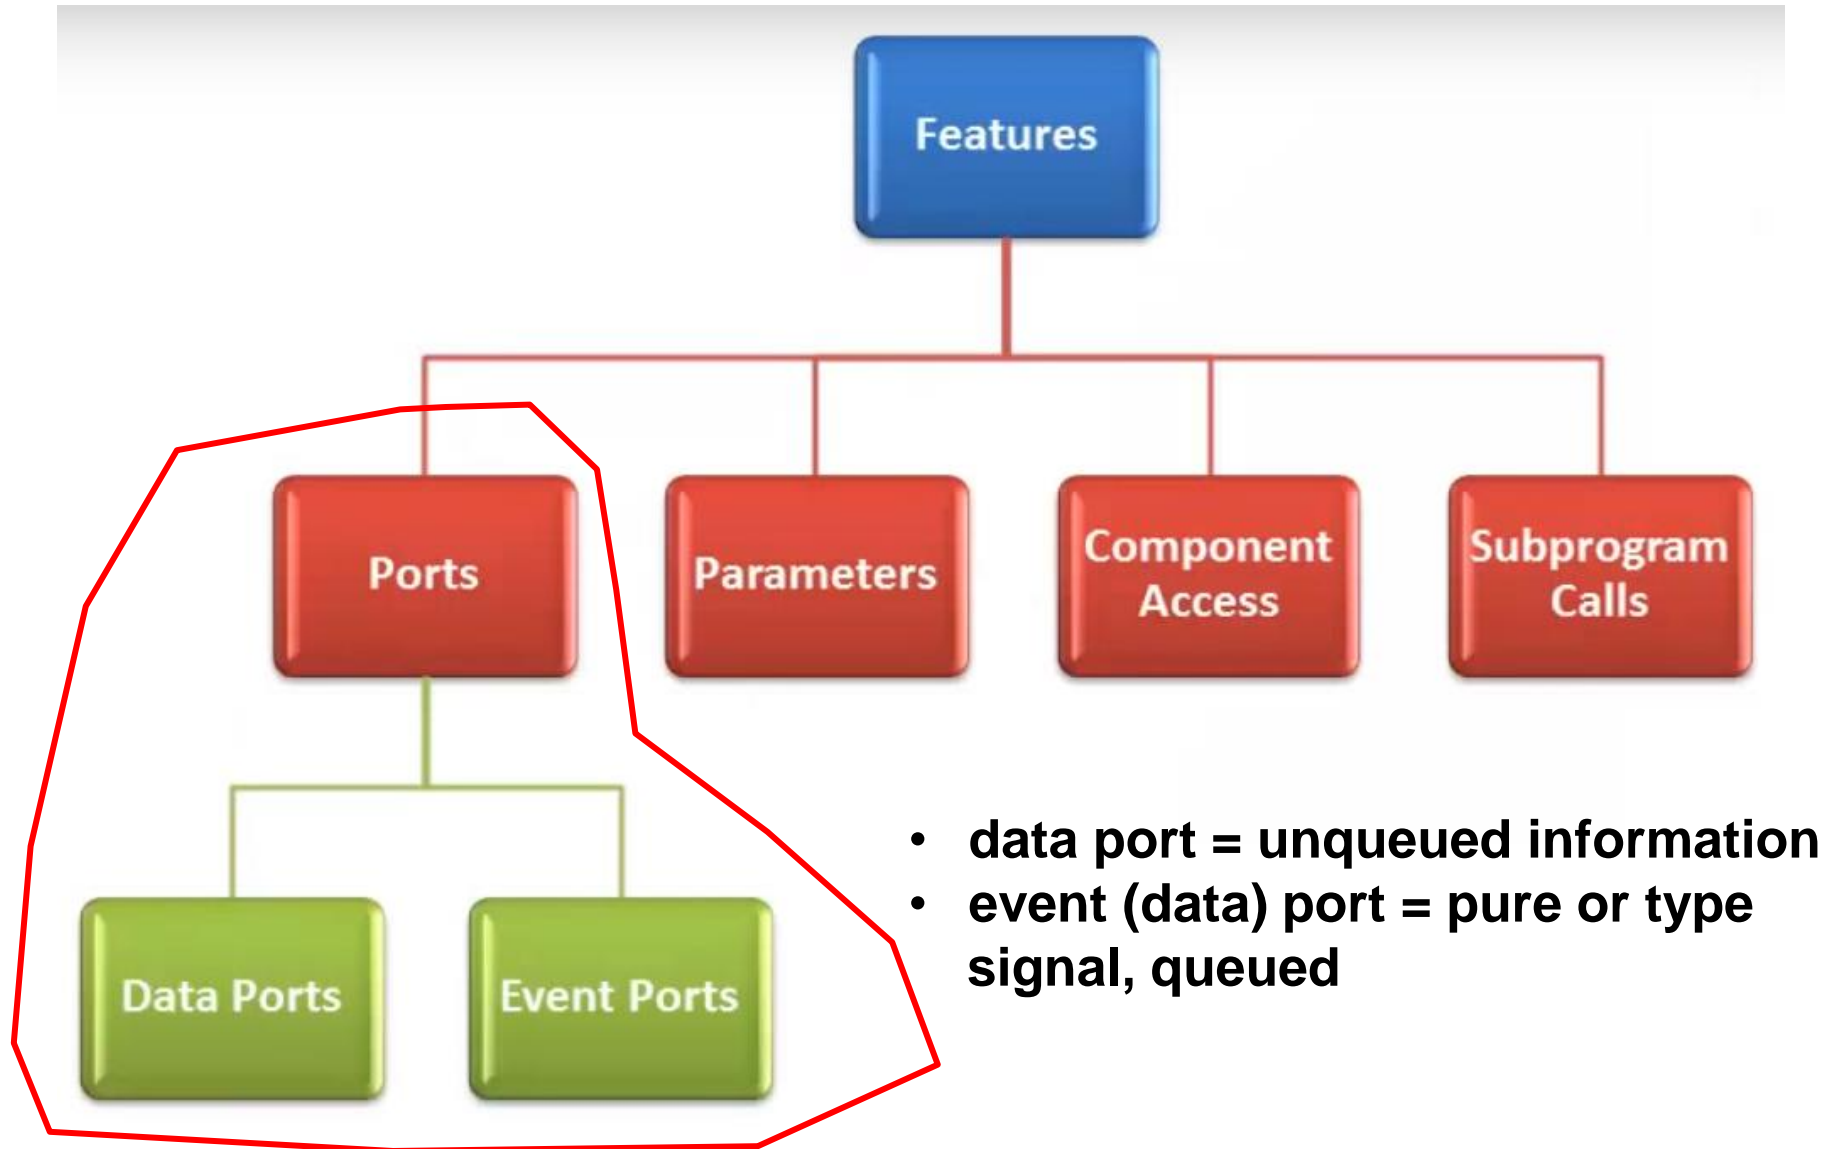

⊖ system implementation AnimalDetectionSystem.impl
    subcomponents
        this_heat_detection_sensor : device HeatDetectionSensor;
        this_sound_sensor : device SoundSensor;
        this_camera : device Camera;
        this_controller : process Controller;
    end AnimalDetectionSystem.impl;

⊖ process Controller
    end Controller;

⊖ process implementation Controller.impl
    end Controller.impl;

⊖ device HeatDetectionSensor
    end HeatDetectionSensor;
```

Add Port Features

Add Ports

```
system implementation AnimalDetectionSystem.impl
  subcomponents
    this_heat_detection_sensor : device HeatDetectionSensor;
    this_sound_sensor : device SoundSensor;
    this_camera : device Camera;
    this_controller : process Controller;
  connections
    sound_connection : port this_sound_sensor.sound_detect -> this_controller.sound_in;
    heat_connection : port this_heat_detection_sensor.heat_detect -> this_controller.heat_in;
    camera_connection : port this_controller.camera_out -> this_camera.camera_control;
    video_connection : port this_camera.video_out -> this_controller.video_in;
end AnimalDetectionSystem.impl;

process Controller
  features
    heat_in : in event port;
    sound_in : in event port;
    camera_out : out event port;
    video_in : in data port;
end Controller;

process implementation Controller.impl
end Controller.impl;

device HeatDetectionSensor
  features
    heat_detect : out event port;
end HeatDetectionSensor;
```

Add Connections between Ports

system implementation AnimalDetectionSystem.impl

subcomponents

this_heat_detection_sensor : device HeatDetectionSensor;

this_sound_sensor : device SoundSensor;

this_camera : device Camera;

this_controller : process Controller;

connections

sound_connection : port this_sound_sensor.sound_detect -> this_controller.sound_in;

heat_connection : port this_heat_detection_sensor.heat_detect -> this_controller.heat_in;

camera_connection : port this_controller.camera_out -> this_camera.camera_control;

video_connection : port this_camera.video_out -> this_controller.video_in;

end AnimalDetectionSystem.impl;

process Controller

features

heat_in : in event port;

sound_in : in event port;

camera_out : out event port;

video_in : in data port;

end Controller;

process implementation Controller.impl

end Controller.impl;

device HeatDetectionSensor

features

heat_detect : out event port;

end HeatDetectionSensor;

Add Threads

```
process Controller
  features
    heat_in : in event port;
    sound_in : in event port;
    camera_out : out event port;
    video_in : in data port;
  end Controller;

process implementation Controller.impl
  subcomponents
    heat_thread: thread ReadHeat.impl;
    sound_thread: thread ReadSound.impl;
    control_thread: thread ControlDevices.impl;
    video_thread: thread ProcessVideo.impl;
  end Controller.impl;

thread ReadHeat
  features
    heat_in : in event port;
  end ReadHeat;

thread implementation ReadHeat.impl

  end ReadHeat.impl;

thread ReadSound
  features
    sound_in : in event port;
  end ReadSound;

thread implementation ReadSound.impl

  end ReadSound.impl;
```

Connect Ports to Threads

```
process Controller
  features
    heat_in : in event port;
    sound_in : in event port;
    camera_out : out event port;
    video_in : in data port;
  end Controller;

process implementation Controller.impl
  subcomponents
    heat_thread: thread ReadHeat.impl;
    sound_thread: thread ReadSound.impl;
    control_thread: thread ControlDevices.impl;
    video_thread: thread ProcessVideo.impl;
  connections
    heat_thread_conn : port heat_in -> heat_thread.heat_in;
    sound_thread_conn : port sound_in -> sound_thread.sound_in;
    control_thread_conn : port control_thread.camera_out -> camera_out;
    video_thread_conn : port video_in -> video_thread.video_in;
  end Controller.impl;
```
