Hwk1 Solution 2014

- 1. (5 points) The feasible interval of each job in the precedence graph (shown below) is given next to its name. The execution time of all jobs is equal to 1.
 - a. Find the effective release times and effective deadlines of the jobs in the precedence graph. Recall that run time is not used in computing effective release times and effective deadlines.

Job	Effective Release Time	Effective Deadline	
$\overline{\mathbf{J}_1}$	1	4	
\mathbf{J}_2	2	4	
J_3	2	9	
J_4	2	4	
J_5	2	8	
J_6	2	10	
J_7	2	5	
J_8	6	8	
J_9	6	8	

b. Find a feasible schedule of the jobs on a single processor using their effective release times and effective deadlines. To find a feasible schedule, use the fact that each job runs for 1 time unit and adjust the effective times to compute possible release times and deadlines; e.g., the effective release time of job J_2 is 2, but the earliest possible release time of job J_2 is 3 because job J_4 will run for 1 unit of time; if it is released at time 2, it won't finish until time 3.

Job	Feasible Release Time	Feasible Deadline
$\overline{\mathbf{J}_1}$	1	3
J_2	2	4 => J4 in (2,3) => J1 in (1,2)
J_3	2	9
J_4	2	3 = 32 in (3,4)
J_5	3	6
J_6	4	10
J_7	3	5 + J2 in (3,4) => J7 in (4,5)
J_8	6	7
J_9	7	8

Schedule: J1 -> J4 -> J2 -> J7 -> J5 -> J8 -> J9 -> J3 -> J6

2. (10 pts.) Consider the task set consisting of the following three preemptive, periodic tasks (denoted using the notation $\tau_i = (p_i, e_i, D_i)$):

$$\tau_1 = (8, 2, 8)$$
 $\tau_2 = (16, 3, 16)$

```
\tau_3 = (16, 5, 8)
```

The system is to be scheduled and executed using a fixed cyclic schedule.

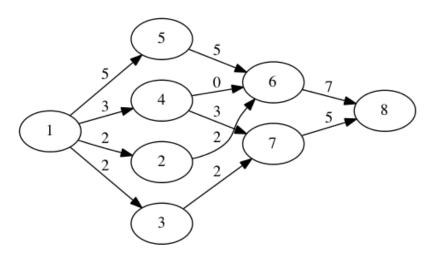

a) Using a frame size of 8, define a network flow graph that can be used to find a fixed (static) cyclic schedule of the tasks using a maximum network flow algorithm. Hint: Remember to indicate maximum allowable flows on all edges in the graph used as input. Upload as hwk1.inp.

Other inputs are equivalent, for example, they could have an edge with zero flow from 5 to 7.

b) Use hwk1.inp as input the hi_pr to determine the maximum network flow on each edge using the command: hi_pr < hwk1.inp > hwk1.out. Upload the output as hwk1.out.

c) Convert the output to graphics format using the custom convert code: convert 4 2 hw1.out hwk1.gr and then to graphics using the GraphViz command: dot -Tpng -o hwk1.png hwk1.gr, or the editor Gvedit available online at http://www.graphviz.org.

3. (10 points) Consider the synchronous task set shown in Table 1 (on the next page). This task set comes from an embedded signal processing application for an anti-submarine warfare (ASW) system. More specifically, the task set is a modified subset of the tasks that implement the Directed Low Frequency Analysis and Recording (DIFAR) acoustic signal processing application from the Airborne Low Frequency Sonar (ALFS) system of the U.S. Navy's SH-60B LAMPS MK III anti-submarine helicopter. The ALFS system processes low frequency signals received by sono-buoys in the water. Its primary function is to detect and track submarines and to calculate range and bearing estimates to each target. The task set shown in Table 1 represents an implementation of a portion of the DIFAR application on a Mercury PowerPC 6U VME board with a 200MHz 603e processor. This portion of the DIFAR application processes five bands of Constant Resolution (CR) data from each of five sono-buoys. In this assignment, we will assume all tasks are independent.

- b. What is the Hyperperiod (H) of the task set? 6000
- What are the possible frame sizes that could be used to create a static cyclic schedule for this task set?
 - (i) $f \ge 40.823$, the deadline of task 40.
 - (ii) f divides evenly into the hyperperiod, so starting with those that satisfy (i), we have 50, 60, 75, 100, 125, 150, 200, 250, 300, etc...
 - (iii) There must be at least one frame between the release and deadline of each task. Note that all of these tasks have periods equal to their deadlines, and all are multiples of 250, so this condition is satisfied for frames sizes 50, 100, 125, 150, 200, and 250.

I chose to use the largest possible frame size which is 250.

d. Create a static cyclic schedule for the task set (you may want to create a program to do this using a Maximum Network Flow algorithm). Turn in the scheduled created. If you wrote a program to generate the schedule or the input to a maximum network flow algorithm, please turn it in as well. You can retrieve a text file containing the task parameters in 4-tuple form from: http://www.cis.ksu.edu/~neilsen/cis721/HW1table1.txt.

Using the generator from http://www.cis.ksu.edu/~neilsen/cis721/generator.c, I produced the input data set http://www.cis.ksu.edu/~neilsen/cis721/data.inp.

```
All input is scaled by 10000 to generate integral input to hi_pr.
        gcc –o myGen generator.c
        ./myGen
        \rightarrow max flow = 4874.1941 sec. = 48741941 units.
        ./hi_pr < data.inp > data.out
           Source = node 1
           Sink = node 750
           Jobs = nodes 2 to 725 = 724 jobs
           Frames = nodes 726 to 749 = 24 frames
